

CODEIGNITER AND BOOTSTRP

Chamodhi Satharasinghe INDEX NUMBER 18001521

About Application

This application is about mushroom information and community hub named as "KINOKO". Web has five main pages. Those are, Home, Library, Members, Login and Signup pages. Home page has brief introduction about the company. And Library has photo library where has a option to upload images. Member page Shows the data of the users table of the database and has functionalities to delete and update data and generate pdf file including users' data. Login form has a form to login user into the system, the functionalities are not implemented. Sign up page has a register form where we can create new record of users details by giving required valid details. Every page was included with header and footer component where header has a navigation bar and a carousel and footer includes the contact details.

Implementation Details

For implement this application we used:

- XAMPP server
- Mysql database
- Bootstrap 4
- Codeigniter 3.1.11

To the front end we developed 5 main views connected to navigation bar. Those are,

- home.php
- viewImages.php
- members.php
- login.php
- signup.php

And other two sub views are created as,

- update.php
- library.php

where update.php includes the update user form, which was called upon by update button of the members table. And the library view is called by "Add New Variety" button of viewImage.

Also, two partial views are created as *header.php* and *footer.php* to include header and footer to every page. And above 7 view were included by these partials.

We have two controllers as *Home.php* and *Signup.php*, where home controller is the main controller which is responsible to load views and execute some main functionalities like delete and generate report. And Signup.php is responsible to sign up and update user.

And we have two models as *Mod_user.php* and *queries.php* where Mod_user.php is responsible about database's users table functionalities while queries.php is responsible of tbl_image table's functionalities.

In the database we have two tables,

- users
- tbl_image

users table contains all users' details and tbl_image contains the paths of images in the where library outputs. To contain images uploaded through the application, we created a *uploads* folder in the main

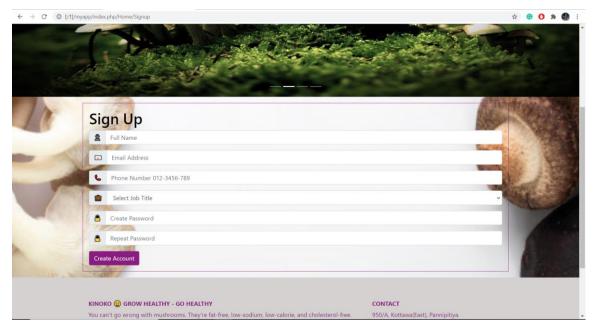

myapp folder. And other images like background images where saved in *image* folder in the main myapp folder.

Also, we added *css* and *js* folders to the main myapp folder which was called in the header.php to include bootstrap to the web application. Apart from default bootstrap setting, I added some custom settings which was included in the *main.css* file of the css folder and *main.js* folder of the js folder.

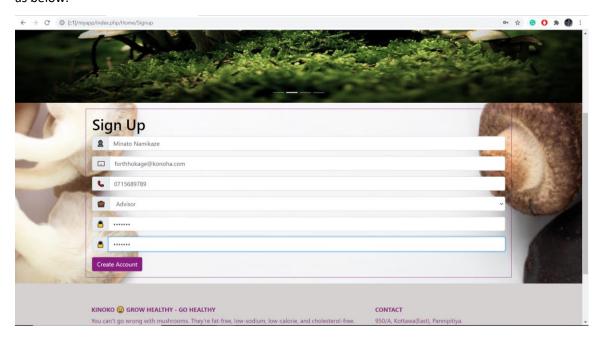

CRUD Operations

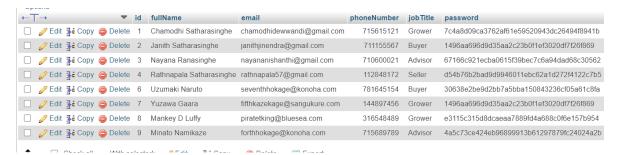

Create

There are two places where we create data. One is when a user sign up to the system, and other one is when user upload a image.

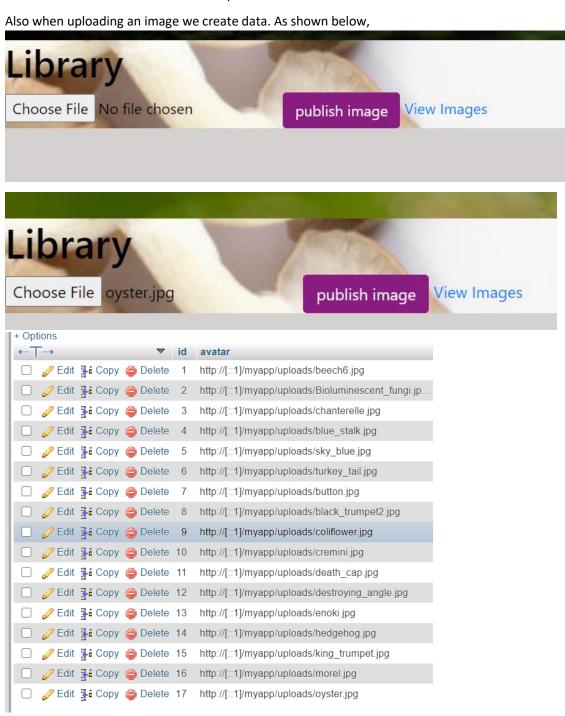

This is how the sign up form apperes. When we give valid data it will create a new record in our database as below.

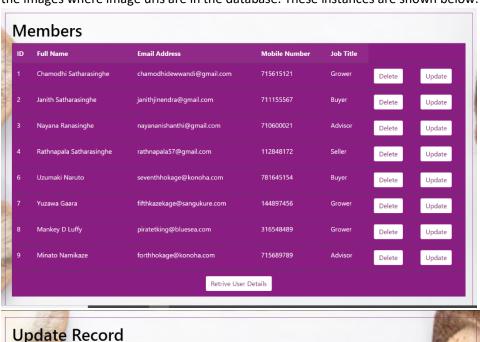

The last record was created successfully.

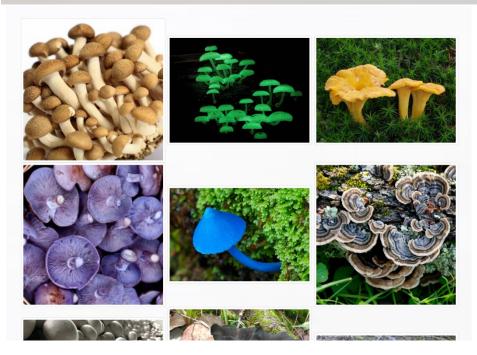

Read

There are three instances where it reads the data one is when showing the member details table and when updating the user details it fill the areas automatically by retrieving the data and the library shows the images where image urls are in the database. These instances are shown below.

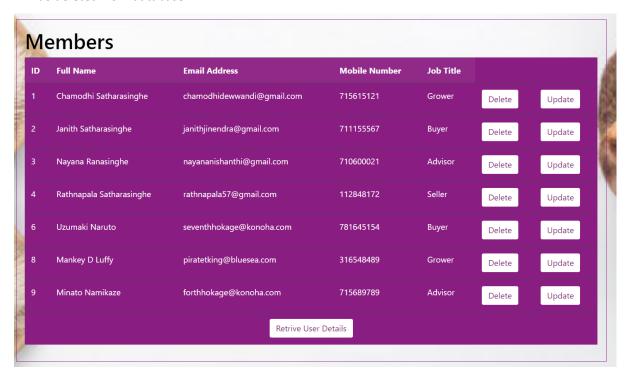

Update

As you can see above update form which appears when click the update button. We can change data of the database.

Delete

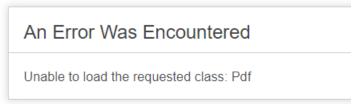

This also same as the previous where we can delete using the delete button and the record of that user will be deleted from database.

As you can see above one record has been deleted.

Generate Report

I tried to generate report but using pdf library, but the system gives and error msg as shown below,

this appears after clicking the retrieve user

details button. And I couldn't find a proper solution for that.
